

Case Study

RPA Agile Development

Industry: Information Services

Project Background:

A global information provider needed to convert all their Kofax automations into UiPath due to a recent merger where the parent company is using UiPath as their main RPA platform. This created a need to consolidate their existing automations by converting hundreds of Kofax bots to UiPath in a record-timeline.

Challenges:

Due to license expiration, speed was a high priority. The client needed to transition 400 of their legacy Kofax bots to UiPath under 6 months.

The client lacked internal knowledge of RPA processes, and a coordinated development style to accelerate development speed and ensure a smooth transition.

The client had outdated and missing VSOPs.

Solutions:

- JOLT deployed UiPath certified resources to lead the transition and perform BOT translation for the technical and solution design.
- JOLT prioritized the scripts with the highest value to help realize maximum impact within a minimum window of time.
- JOLT initiated Kanban process to improve delivery.
- JOLT trained Informa to manage process from VSOP creation to production release.

Results:

400 Bots

The JOLT team deployed 400 bots under 16 weeks

45 Bots per Week

With our agile methodology, the JOLT team reached a cadence of delivering 45 bots per week on the first half of the project timeline.
